## 1. Executive summary

### Overview of organization and reporting period

VKEPL is an engineering and contracting firm operating in India that provides on-site engineering, construction and related contractor services and integrates Environmental, Social and Governance (ESG) principles into operations. This report covers the 12-month reporting period April 2024 – March 2025 (assumed; see Assumptions). Activity data and calculations were taken from the submitted GHG data collection and calculation file.

### Key emission results (summary)

- **Total GHG emissions (CO<sub>2</sub>e): 2,665.7 tCO<sub>2</sub>e** (total of Scope 1 + Scope 2 + Scope 3 upstream + Scope 3 downstream).
- **By scope:**
  - Scope 1 (direct): **18.4 tCO<sub>2</sub>e** (diesel).
  - Scope 2 (indirect electricity): **12 tCO<sub>2</sub>e**.
  - Scope 3 (upstream): **2,635.1 tCO<sub>2</sub>e** (materials, commuting, waste, travel, water, etc.).
  - Scope 3 (downstream): **0.26 tCO<sub>2</sub>e** (finished goods transport).

### Highlights & reduction achievements

- The bulk of the footprint (≈99%) is in Scope 3 upstream (raw materials and construction-related materials). This identifies the supply chain and materials as priority areas for reduction.
- On-site emissions (Scope 1 + Scope 2) are comparatively small (≈1.1% of total), indicating opportunities to target supplier engagement, material selection and transport optimization for the most impact.

## 2. Introduction

### Purpose of the report

This report documents the GHG inventory for VKEPL for the reporting period, following ISO 14064-1 and the GHG Protocol. It is intended to present transparent, auditable emissions for internal management, stakeholder disclosure, and to support any regulatory, customer, or voluntary reporting needs.

### Intended users

Management, Board, customers and clients requesting emissions data, supply chain partners, potential verifiers, and external stakeholders (investors, regulators).

### Reporting objectives

- Provide an auditable inventory consistent with ISO 14064-1 and GHG Protocol standards.
- Identify emission hotspots and inform reduction strategy and targets.
- Satisfy voluntary/customer reporting requirements and prepare for potential third-party verification.

|                                                                                   |                                                                                                                                                                                             |                                     |

### 3. Organization description

#### Company profile

VKEPL (Vastu Kirti Engg Pvt Ltd) — engineering & contracting services in India (detailed company profile maintained by management).

#### Organizational structure

Company functions included in this report: Project delivery/operations (construction sites), corporate office operations, transport/logistics for materials and site transfers. (Full org chart should be appended to internal records.)

#### Operations, facilities, and boundaries

Covered entities: Corporate office and project sites active during the reporting period. Emissions from owned/leased buildings, owned fuel use, business travel and project-related materials and waste are included as per sections below.

### 4. Reporting boundary

#### Organizational boundary

Reporting follows **Operational control** approach (emissions from operations where VKEPL has control are included). If Equity or other approach is desired, adjustments must be made.

#### Operational boundary

- Included: Direct GHG emissions from on-site fuel (diesel), purchased electricity, upstream and downstream Scope 3 categories identified in the file (materials, transport, commuting, business travel, waste, water).
- Excluded: Any out-of-scope entities not under operational control or for which no data were available (documented in Assumptions).

#### Entities and locations covered

All Indian sites and offices for which activity data were provided in the uploaded dataset.

### 5. Reporting period

#### Start date & end date

Assumed April 2024 – March 2025 (please confirm if you require fiscal year or alternate period). This assumption was used because the uploaded dataset did not explicitly state the period.

|                                                                                   | <b>GHG EMISSION REPORT</b>                                                                                                                                                                  | Date : 21 <sup>st</sup> April, 2025 |

## Frequency of reporting

Annual reporting (once per 12-month period). Company may opt for quarterly internal updates.

## 6. GHG accounting methodology

### Standards followed

- ISO 14064-1:2018 (Organization level GHG inventories) — methodology and reporting principles.
- GHG Protocol Corporate Standard for classification and scope approach.

### Calculation approach

Activity data × emission factor approach. For each source: Activity units (litres, kWh, km, tonnes, kg) × emission factor (kg CO<sub>2</sub>e/unit) = emissions. Aggregation to tCO<sub>2</sub>e. This method was used in the provided calculations.

### Tools or software used

Calculations were performed in spreadsheet format (source file provided). For future reporting use, recommend using a centralized GHG inventory tool (or maintained workbook) with version control.

## 7. Emission sources identification

### List of included direct and indirect sources

- **Scope 1 (Direct):** Diesel for internal operations (site equipment, on-site generators).
- **Scope 2 (Indirect):** Purchased electricity (kWh).
- **Scope 3 (Upstream & Downstream):** Purchased goods & services (raw materials and project materials), bricks, waste (office & project), water use, employee commuting, business travel (air), transport of raw materials to customers, finished goods dispatch.

### Mapping of emission sources in facilities

- Corporate office: electricity, office waste, water, commuting, small materials.
- Project sites: diesel consumption, large material usage (tons), construction waste, transport.

### Scope categorization

Assigned following GHG Protocol category guidance (Scopes 1, 2, and 3 categories as provided).

|                                                                                   |                                                                                                                                                                                             |                                     |

|                                                                                   | <b>GHG EMISSION REPORT</b>                                                                                                                                                                  | Date : 21 <sup>st</sup> April, 2025 |

## 8. GHG scope classification & detailed sources

### 8.1 Scope 1 — Direct emissions

- **Stationary combustion:** Diesel used on-site (6,860 L/year) → **18.4 tCO<sub>2</sub>e**.
- **Mobile combustion / company vehicles:** (If present, included in diesel figure or reported separately if vehicle fuel tracked.)
- **Fugitive/process emissions:** Not reported / not applicable / no refrigerant or process emissions reported in dataset.

### 8.2 Scope 2 — Indirect energy emissions

- **Purchased electricity:** 14,619 kWh × 0.82 kg CO<sub>2</sub>e/kWh = **11,986 kg CO<sub>2</sub>e ≈ 12 tCO<sub>2</sub>e**.

### 8.3 Scope 3 — Other indirect emissions (selected categories)

From the provided calculations (upstream + downstream categories):

- Purchased raw materials (project-related): 2,798 tons → **2,518.2 tCO<sub>2</sub>e**.
- Office raw materials / small items: 0.188 t → **0.169 tCO<sub>2</sub>e**.
- Bricks: 260,000 units → **0.312 tCO<sub>2</sub>e**.
- Employee commuting (road): 79,143 km → **9.5 tCO<sub>2</sub>e**.
- Business air travel: 47,248 km → **7.46 tCO<sub>2</sub>e**.
- Waste (office & construction): office 0.384 tCO<sub>2</sub>e; construction 99.7 tCO<sub>2</sub>e.
- Water consumption (119 kL): **0.041 tCO<sub>2</sub>e**.
- Transport of raw materials to customers and finished goods dispatch: small values included in Scope 3 upstream and downstream totals.

## 9. GHG data collection & quality

### Data sources & collection method

- Fuel volumes (litres): fuel purchase/consumption logs.
  - Electricity (kWh): utility bills / meter readings.
  - Material tonnages: procurement records / project material delivery notes.
  - Transport distances (km): travel logs, expense claims, or estimated routing distances.
- All activity figures and calculation worksheets are in the uploaded file.

### Accuracy, completeness & reliability

- On-site fuel and electricity come from invoices (high confidence).
- Material tonnages for project materials are from procurement records (medium–high confidence).
- Commuting and some transport distances are based on estimates/claims (lower confidence); these should be improved by staff surveys or telematics for the next cycle.

|                                                                                   | <b>GHG EMISSION REPORT</b>                                                                                                                                                                  | Date : 21 <sup>st</sup> April, 2025 |

## Data management procedure & controls

- Recommended: central spreadsheet with clear versioning, source document links, sign-off by department owners, and periodic internal audit. Maintain raw backups of invoices, delivery notes and travel logs.

## 10. Emission factors

### Source of emission factors used in calculations

The dataset applies emission factors (examples shown): diesel 2.68 kg CO<sub>2</sub>e/L; electricity 0.82 kg CO<sub>2</sub>e/kWh; brick factor 1.2 kg CO<sub>2</sub>e per 1,000 bricks; road transport 0.12 kg CO<sub>2</sub>e/km; air travel 0.158 kg CO<sub>2</sub>e/km; waste factor 0.717 kg CO<sub>2</sub>e/kg; water 0.344 kg CO<sub>2</sub>e/kL; raw material factors 0.9 tCO<sub>2</sub>e/ton for some material categories. These factors were used as in the uploaded calculations.

### Units and justification

All emission factors are expressed in kg or t CO<sub>2</sub>e per unit activity. For formal reporting, each factor should be referenced to a recognized source (IPCC, DEFRA, GHG Protocol databases, national factors or India-specific grid factors). Maintain a reference table (Appendix) with exact source, year and URL for each factor.

## 11. Calculation results

### 11.1 Total GHG emissions (by scope)

| Scope                 | Emissions (tCO <sub>2</sub> e) |
|-----------------------|--------------------------------|
| Scope 1 (diesel)      | 18.4                           |
| Scope 2 (electricity) | 12.0                           |
| Scope 3 — Upstream    | 2,635.1                        |
| Scope 3 — Downstream  | 0.26                           |
| <b>Total</b>          | <b>2,665.7</b>                 |

### Gas-wise breakout for Scope 1

All Scope 1 emissions arise from diesel combustion: **Diesel (CO<sub>2</sub>e) = 18.4 tCO<sub>2</sub>e**. (CH<sub>4</sub>/N<sub>2</sub>O were not separately reported in the dataset; if required, apply IPCC default GWP multipliers and fuel emission split.)

### 11.2 Emission breakdown by source (top contributors)

- Top contributor:** Purchased raw/project materials — **2,518.2 tCO<sub>2</sub>e** (≈94.4% of total).
- Construction waste (indirect): **99.7 tCO<sub>2</sub>e**.
- Employee commuting and travel combined ≈ **16.96 tCO<sub>2</sub>e**.

|                                                                                   |                                                                                                                                                                                             |                                     |

|                                                                                   |                                                                                                                                                                                             | Rev No : 00                         |
|                                                                                   | <b>GHG EMISSION REPORT</b>                                                                                                                                                                  | Date : 21 <sup>st</sup> April, 2025 |

### 11.3 Emission intensity indicators

Where activity data are incomplete (e.g., employees), assumptions were made (see next section). Using the assumption of **40 employees** for the reporting period (please confirm the actual headcount), the intensity indicators are:

- **Total CO<sub>2</sub>e per employee:**  $2,665.7 \text{ tCO}_2\text{e} \div 40 = 66.64 \text{ tCO}_2\text{e} / \text{employee} / \text{year}$ . (Assumption)
- **CO<sub>2</sub>e per ton of raw material used:**  $2,665.7 \text{ tCO}_2\text{e} \div 2,798 \text{ tons raw material} = 0.95 \text{ tCO}_2\text{e} / \text{ton material}$ . (Useful for project comparison.)

**Note:** Both intensity indicators require confirmation of employee count and production/throughput measures for accuracy.

## 12. Base year & trend analysis

### Base year selection & justification

No explicit prior year data were provided. For trend analysis and target setting, select a base year (e.g., 2024 as base year) or use a multi-year average where data are available. Using a single year (2024) as base is acceptable when historical data are limited, but future years should aim to build a time series.

### Historical comparison & adjustments

If organizational boundary changes or acquisitions occur, normalize emissions (e.g., intensity metrics) and apply recalculation rules per ISO 14064-1.

## 13. Uncertainty assessment

### Sources of uncertainty

- Emission factors (e.g., grid emission factor variability).
- Estimated activity data (commuting distances, some material transport distances).
- Assumptions on material emission factors (0.9 tCO<sub>2</sub>e/ton used generically).

### Method used to estimate uncertainty

Qualitative rating per source (high/medium/low) and quantitative  $\pm\%$  ranges where applicable. For example: electricity and fuel invoices ( $\pm 5\%$ ); estimated commuting ( $\pm 30\%$ ); material factors ( $\pm 10\text{--}30\%$  depending on specificity).

### Confidence level

Overall inventory confidence: **medium**. Highest confidence for Scope 1 & 2; lower confidence for some Scope 3 components.

|                                                                                   | <b>GHG EMISSION REPORT</b>                                                                                                                                                                  | Date : 21 <sup>st</sup> April, 2025 |

## 14. Data quality assessment

### Quality rating for activity data & emission factors

- Scope 1 fuel (diesel): **High** (invoice-based).
- Scope 2 electricity: **High** (utility bills).
- Scope 3 material tonnages: **Medium** (procurement/delivery records).
- Commuting & some transport distances: **Low–Medium** (estimates / assumptions).

### Cross-checks & validations

- Reconcile fuel and electricity totals with financial/operational records.
- Request supplier life-cycle data for high-impact materials to improve accuracy.

## 15. GHG reduction initiatives (recommended & in progress)

Because the majority of emissions are Scope 3 (materials), the priority is upstream engagement and material choices:

### Immediate / near term (0–2 years)

1. **Supplier engagement:** Request supplier EPDs (Environmental Product Declarations) or carbon intensity data. Prioritize lower-carbon materials and local suppliers to reduce transport emissions.
2. **Material optimization:** Redesign to reduce material quantities (value engineering) and substitute with lower-carbon alternatives where feasible.
3. **Construction waste management:** Improve on-site waste segregation, reuse and recycling to reduce waste emissions.
4. **Travel & commuting:** Promote teleconferencing, optimize travel plans, encourage carpooling and public transport; consider a commuting survey to refine data.
5. **Energy efficiency:** Upgrade lighting/office equipment, regular maintenance of generators and equipment to reduce diesel consumption.

### Medium term (2–5 years)

6. **Supply chain decarbonization:** Contract clauses for low-carbon materials, prefers suppliers with verified emissions.
7. **Renewable electricity:** Procure renewable electricity (PPA or Renewable Energy Certificates) to reduce Scope 2 and optionally claim residual mix per applicable guidance.
8. **Fleet electrification:** Where company vehicles exist, plan phased electrification.

### Long term

Set science-based targets (SBTi) or internal targets to reduce absolute or intensity-based emissions — especially focused on the material supply chain.

|                                                                                   |                                                                                                                                                                                             |                                     |

|                                                                                   |                                                                                                                                                                                             | Rev No : 00                         |
|                                                                                   | <b>GHG EMISSION REPORT</b>                                                                                                                                                                  | Date : 21 <sup>st</sup> April, 2025 |

## 16. (renumbered) Monitoring, verification & improvement plan

- **Monitoring:** Maintain centralized data system, monthly reconciliation of fuel and electricity, and project level material capture.
- **Verification:** Prepare for third-party verification per ISO 14064-3. Create documentation pack (invoices, delivery notes, travel records, calculation files).
- **Continuous improvement:** Annual review, update emission factors to latest published sources, and refine Scope 3 data collection (supplier questionnaires).

## 17. Conclusions

### Summary of GHG performance

- Total footprint for the reporting year is 2,665.7 tCO<sub>2</sub>e. Scope 3 upstream is the dominant source.

### Success & opportunities

- **Strength:** Low on-site emissions; clear opportunity to reduce upstream/material emissions through supply chain measures.
- **Opportunity:** Supplier engagement, material substitution, and waste management will deliver the highest reductions.

### Plan for next reporting period

- Confirm/replace assumptions (reporting period, employee count).
- Implement supplier data capture for top 10 materials (by tonnage/emissions).
- Run a commuting survey and capture project transport telematics where possible.
- Consider target setting (e.g., 10–20% reduction in supplier-related emissions over 3–5 years depending on interventions).

## 18. (numbering continued) Recommendations for target setting

- Use baseline year (2024) for initial target setting.
- Consider intensity target (e.g., tCO<sub>2</sub>e per ton of project material or per project) in addition to absolute target to account for growth.
- For credibility, develop a roadmap to align with SBTi guidance (if pursuing formal SBTi approval).

## 19. Appendices

### Appendix A — Activity data & calculation summary (from uploaded file)

(abridged table — full spreadsheet is in the uploaded workbook). All figures taken from the provided GHG calculation file.

| Source                   | Activity                       | Unit                                          | Emission factor                 | Emissions (tCO <sub>2</sub> e) |
|--------------------------|--------------------------------|-----------------------------------------------|---------------------------------|--------------------------------|
| Diesel (Scope 1)         | Diesel for internal operations | 6,860 L                                       | 2.68 kg CO <sub>2</sub> e / L   | 18.4                           |
| Electricity (Scope 2)    | Purchased electricity          | 14,619 kWh                                    | 0.82 kg CO <sub>2</sub> e / kWh | 12.0                           |
| Raw materials (upstream) | Project materials              | 2,798 ton                                     | 0.9 tCO <sub>2</sub> e / ton    | 2,518.2                        |
| Office raw materials     | 188 kg                         | 0.9 tCO <sub>2</sub> e / ton<br>(0.0009 t/kg) | 0.169                           |                                |
| Bricks                   | 260,000 nos                    | 1.2 kg / 1000 bricks                          | 0.312                           |                                |
| Employee commuting       | 79,143 km                      | 0.12 kg CO <sub>2</sub> e / km                | 9.5                             |                                |
| Business air travel      | 47,248 km                      | 0.158 kg CO <sub>2</sub> e / km               | 7.46                            |                                |
| Waste — office           | 535 kg                         | 0.717 kg CO <sub>2</sub> e / kg               | 0.384                           |                                |
| Waste — construction     | 139 ton                        | 0.717 tCO <sub>2</sub> e / ton                | 99.7                            |                                |
| Water                    | 119 kL                         | 0.344 kg CO <sub>2</sub> e / kL               | 0.041                           |                                |
| Raw material transport   | 2,880 km                       | 0.12 kg / km                                  | 0.346                           |                                |
| Finished goods dispatch  | 2,160 km                       | 0.12 kg / km                                  | 0.259                           |                                |

### Appendix B — Emission factor references (recommended)

(For formal reporting, replace the generic factors below with exact references and versions used in calculations.) Example authoritative sources to cite: IPCC Guidelines, DEFRA/BEIS emission factors, GHG Protocol emission factor database, India Central Electricity Authority / national grid emission factor publications, and supplier EPDs.

### Appendix C — Definitions & abbreviations

- GHG = Greenhouse Gas
- CO<sub>2</sub>e = Carbon dioxide equivalent
- tCO<sub>2</sub>e = metric tonnes CO<sub>2</sub>e
- Scope 1, 2, 3 as per GHG Protocol.

## Appendix D — Assumptions & limitations

1. **Reporting period assumed:** 1 Jan 2024–31 Dec 2024 because data file did not specify period.
2. **Employee count assumed for intensity calculation: 40 employees** (user must confirm actual headcount).
3. **Emission factors & source detail:** The file used generic factors; for verification and higher confidence, each factor should be traced to a published source and replaced by country-specific or product-specific factors where available.
